Electric transportation options continue to increase as more medium- and heavy-duty electric vehicles enter the market. Cities, schools, airports and other large organizations are specifically recognizing the benefits of making the switch to electric buses.

**Benefits**

**Fuel Cost Savings**

Electric buses are highly efficient, and running on 100% electricity is cheaper than diesel fuel. Electricity is also locally generated, and prices have historically been more stable than diesel.

**Maintenance Cost Savings**

Electric buses have fewer moving parts than their non-electric counterparts. Between fuel and maintenance savings, electric buses can save hundreds of thousands of dollars over their lifetimes, which can be invested back into the organization or community.

**Economic Development**

As demand for electric vehicles increases, more opportunities will be created for research and development, manufacturing, electrical contracting and more. In this region, there are already electric buses being designed and assembled, as well as increases in battery and charging equipment manufacturing.

**Air Improvements**

Both transit and school buses are often used in areas with high concentrations of people, and children are particularly susceptible to the negative effects of pollution, which has been linked to asthma and poor test performance in schools. Without vehicle emissions and particulates, electric buses provide cleaner air for our communities. They are even superior when considering the electricity needed for charging.

**Grid Resiliency**

Electric buses can improve grid reliability and sustainability by helping to manage peak demand and supporting renewable energy integration. With their large batteries and energy storage capabilities, they also offer strong potential for vehicle-to-grid applications.

**Safety and Reliability**

Electric buses are safe, highly reliable and have similar rates of downtime as diesel buses. They are also much quieter than other technologies, helping to reduce noise pollution.
## Charging Options

*Used mostly for quick opportunity charging

## Case Studies

### Transit Buses
**Raleigh-Durham International Airport**²
- 4 electric buses (more planned)
- Estimated annual fuel savings of $5,000 per bus
- Estimated annual maintenance savings of $20,000 per bus
- 60 kW off-route charging
- Complete a full 8-10 hour shift without needing to charge

### School Buses
**White Plains City School District, New York**³
- 5 electric buses
- Vehicle-to-grid compatible, able to supply power to the grid during summer month peaks
- 4-6 hours of charge time

## By the Numbers

1. **14.7** The mpg a diesel bus would need to achieve for life-cycle emissions to equal that of an electric bus. The actual mpg of a comparable diesel bus is approximately 4.8.⁴
2. **67%** The savings in grams of CO₂ per mile of electric buses when compared to diesel buses and charged with the energy mix of North Carolina.⁴
3. **$2,000** Potential annual fuel savings of electric school buses.⁵
4. **$4,400** Potential annual maintenance savings of electric school buses.⁵
5. **120** Approximate range in miles of electric transit and school buses.
